Porosity calculation is the third step of well log analysis and it could only be done correctly if the first step (lithology interpretation) is correct. There are many methods that can be used to calculate the porosity, the user may use density log, sonic log, neutron log, or combination between them, but the most common one is neutron-density log combination.

Well log analysis for reservoir characterization - AAPG Wiki

The improvement in technology from one generation of well logs to another has been remarkable. This is both an asset and a liability. It is an asset for new fields where the most modern technology can be applied. It is a liability for old fields where old logs must be combined with new logs in the analysis of a field.

Well Logging - an overview | ScienceDirect Topics

Well-logs are single point measurements of physical properties of the subsurface recorded in a well and vary vertically with depth. The properties are random and aperiodic and depend on factors like mineral composition or lithology, porosity, cementation and compaction, presence of fluids etc..

Machine learning applied to geophysical well log data | by ...

Log analysts perform quality control on the data and determine what corrections are required before carrying out quantitative analysis of the data. For example, gas, fractures and lack of compaction require corrections to be applied to the sonic log. Lithologies affect the density, neutron and sonic logs.

Basic Relationships of Well Log Interpretation

Perhaps the best way to begin a study of logging is by introducing the reader to some of the basic con-cepts of well log analysis. Remember that a borehole represents a dynamic system; that fluid used in the drilling of a well affects the rock surrounding the bore-hole and, therefore, log measurements. In addition, the rock surrounding the borehole has certain properties

Applied Well Test Interpretation - SPE Books

Well logging is a study of acquiring information on physical properties of rocks that are exposed during drilling of an oil well. The key purpose of well logging is to obtain petrophysical properties of reservoirs such as Porosity, Permeability, hydrocarbon saturation etc., for hydrocarbon exploration.

The study aims at using well log approach in establishing the sedimentary facies, their successions and environments of deposition in this field. In addition, a well to well correlation and reservoir quality assessment were undertaken. The palaeodepositional environments in the field were deduced by combining gamma ray log trends with core data.
