Introduction To Linear Algebra Strang

As with his classic *Linear Algebra and Its Applications* (Academic Press) from forty years ago, Strang's new edition of *Introduction to Linear Algebra* keeps one eye on the theory, the other on applications, and has the stated goal of "opening linear algebra to the world" (Preface, page x). Aimed at the serious undergraduate student - though not just those undergraduates who fill the lecture halls of MIT, Strang's home institution - the writing is engaging and personal, and the presentation is ...

Linear transformation should be introduced in early chapters as opposed to near the end of the book. The book is very detailed for the first 3 or 4 chapters. Then from time to time you feel there are some gaps you have to fill in with your own proof if you can. Could've done a better job.

Introduction to Linear Algebra by Gilbert Strang

Gilbert Strang Gilbert Strang's textbooks have changed the entire approach to learning linear algebra -- away from abstract vector spaces to specific examples of the four fundamental subspaces: the column space and nullspace of A and A'. This new fifth edition has become more than a textbook for the basic linear algebra course.

A wonderful theorem of linear algebra says that the three rows are not independent either. The third row must lie in the same plane as the first two rows. Some combination of rows 1 and 2 will produce row 3. You might find that combination quickly (I didn't).

Linear Algebra and Its Applications (Fourth Edition)

Until the 19th century, linear algebra was introduced through systems of linear equations and matrices. In modern mathematics, the presentation through vector spaces is generally preferred, since it is more synthetic, more general (not limited to the finite-dimensional case), and conceptually simpler, although more abstract. A vector space over a field F (often the field of the real numbers ...

The row picture for $A = I$ has 3 perpendicular planes $x = 2$ and $y = 4$. Those are perpendicular to the x and y and z axes: $z = 4$ is a horizontal plane at height 4. The column vectors are $i = (1, 0, 0)$ and $j = (0, 1, 0)$ and $k = (0, 0, 1)$. Then $b = (2, 3, 4)$ is the linear combination $2i + 3j + 4k$.
