Computer Science

In computer science, pattern matching is the act of checking a given sequence of tokens for the presence of the constituents of some pattern. In contrast to pattern recognition, the match usually has to be exact: "either it will or will not be a match." The patterns generally have the form of either sequences or

tokens. Unlike pattern recognition, the match has to be exact in the case of pattern matching. Pattern matching is one of the most fundamental and important paradigms in several programming languages.

What is Pattern Matching? - Definition from Techopedia

Read PDF Pattern Matching Algorithms Computer Science Department

Pattern Matching Algorithms Pattern matching in computer vision refers to a set of computational techniques which enable the localization of a template pattern in a sample image or signal. Such template pattern can be a specific facial feature, an object of known characteristics or a speech pattern such as a word.

Pattern Matching Algorithms and their Use in Computer Vision

Pattern searching is an important problem in computer science. When we do search for a string in notepad/word file or browser or database, pattern searching algorithms are used to show the search results. We have discussed

Algorithms - GeeksforGeeks

Although EXACT pattern matching with suffix trees is fast, it is not clear how to use suffix trees for APPROXIMATE pattern matching. In 1994, Michael Burrows and David Wheeler invented an ingenious algorithm for text compression that is now known as Burrows-Wheeler Transform.
